

Green Construction Company Builds Energy Savings with New Lighting

CASE STUDY

Thom Woglom Construction in Pine Island, New York specializes in residential and commercial building, with a focus on incorporating green initiatives. So when it came time to build a new warehouse and workshop for his own company, president Thom Woglom chose energy-saving BLHE Series LED High Bays from MaxLite to illuminate the space.

Woglom Construction installed 36 of the 90-watt version of the BLHE throughout the facility. Each model delivers more than 11,000 lumens but consumes approximately 50 percent less energy vs. traditional four-lamp fluorescent fixtures. The high light output, compact design and clean aesthetic of the BLHE made it the perfect choice for optimizing safety and enhancing the design of the workspace. The long lumen maintenance of 100,000 hours also translates to years of maintenance-free lighting for the busy construction business.

To learn more about the BLHE, and other lighting solutions for commercial and industrial applications, go to MaxLite.com.

“The high bays have transformed our shop and space. The light is well-balanced and has really enhanced our feeling in the space. Simply put, it makes it a happier space!”

**- Thom Woglom,
President**
